CABLE CONTROLS

SAFETY
ACOUSTIC COMFORT
PRECISION CONTROL
ERGONOMIC DRIVER'S POSITION

PRODUCT ADVANTAGES

- → ***Premium quality, interchangeable with original cables***
- → ***High-quality components***
- → ***Complete multi-brand range of 720 products***

With **over 700 products covering 70% of the European fleet**, the Eurorepar range of cables has been designed with the market in mind.

We pay **great attention to parts which can present a safety risk.** The tests carried out on these parts by the supplier **are approved by our experts**.

We constantly manage the quality results of the Eurorepar range using the **same procedures as those applied to the original equipment.**

TECHNICAL CHARACTERISTICS

Eurorepar offers a complete range of control cables:

- **Gearbox control cables**: for automatic and manual gearboxes.
- **Brake control cables**: for drum and disc brakes.
- **Clutch control cables**: with automatic or manual adjustment.
- **Accelerator control cables:** made up of various non-assembled components for compatibility with several vehicles and engines: sheath, cable and ferrule.

The dimensions of our cables (length, shape, characteristics, etc.) are based on **the location of the part on its vehicle application**. This guarantees **correct positioning** (routing and proximity to the powertrain environment, bodywork, suspension components and other circuits, etc.) and **good force control**.

Our cables are maintenance-free and guarantee optimal operation over time (travel, position, force, rigidity, play, absence of noise, etc.).

DID YOU KNOW?

If the handbrake is not operating correctly, the vehicle may fail its MOT. The test will then have to be repeated.

Our parts are guaranteed for 2 years*

SECURE LABELS Avoids any risk to fake parts and guarantees their quality.

www.eurorepar.com

Our parts are guaranteed 2 years* against any manufacturing or material defect**.
(*) For Citroen, DS, Peugeot, Euro Repar Car Service repair networks: the warranty runs for 2 years, parts AND labour included.
(**) For the conditions of application, contact your dealer.

CONDITIONS FOR REPLACEMENT

Cables do not have replacement intervals; they are replaced when they stop performing their function.

Gear selector and shift cable: a jammed cable may cause problems when shifting gear or stiffness in the clutch pedal.

- A faulty clutch cable which is not replaced in time may cause several problems:
  - Wear on the clutch release bearing and fork.
  - Wear on the clutch kit.

Handbrake cable: excessive force or travel, or the brake cannot be disengaged

Accelerator cable: incorrect response time when the pedal is depressed

Gearbox control:

- difficult or impossible to shift gear: cable disconnected
- excessive play or lack of precision in the gear lever (the cable sheath has become detached and moves with the cable).

RECOMMENDATIONS

- **When the rear drum or disc brakes are replaced** with the vehicle on the lift, check the condition of the brake cables.
- **When replacing the clutch**, check the condition of the clutch control
- **When working on a manual or automatic gearbox**, check the condition of the control and offer the customer a preventive replacement to improve the gear shift function.
